# Fluent Capabilities at Different License Levels

Fluent Capabilities Details	Pro	Premium	Enterprise
CAD Import	✓	✓	✓
Steady-state flow (pressure-based coupled solver)	✓	✓	✓
Transient flow (pressure-based segregated solver)	✓	✓	✓
Heat Transfer: fluid energy model, CHT, shell conduction	✓	✓	✓
Basic turbulence models – inviscid, laminar, k-epsilon, k-omega (standard and SST) and Spalart-Allmaras	✓	✓	✓
HPC: 4 HPC cores included, additional core accessed via ANSYS HPC licensing	✓	✓	✓
Porous media (isotropic, orthotropic and conical)	✓	✓	✓
Incompressible, Compressible (ideal gas), Boussinesq approximation, non-Newtonian fluids	✓	✓	✓
Rotating reference frames, multiple reference frames (without periodic interfaces)	✓	✓	✓
Inert and Massless particle tracking	✓	✓	✓
2D fan model	✓	✓	✓
Multi-stream mixing (multiple non-reacting species)	✓	✓	✓
Fluent Meshing: Watertight Meshing workflow including Polyhedral, Poly-Hexcore with Mosaic technology, Tetrahedral and Prism meshing	✓	✓	✓
Fluent Setup and Post Processing, including Reports and Expressions	✓	✓	✓
Parameters, parametric workflow and design points	✓	✓	✓
Workbench integration		✓	✓
Batch solving		✓	✓
TUI (Text User Interface)		✓	✓
Fluent Meshing: Parallel Meshing and Fault Tolerant Meshing		✓	✓
Steady-state flows (all solvers)		✓	✓
Transient flows (all solvers)		✓	✓
Advanced turbulence models		✓	✓
Density-based solver, pressure-based segregated solvers, adjoint solver, 6-DOF solver for flow-driven solid motion		✓	✓
Multiphase including free surface, cavitation, phase change models, thin film model, transition to/from particles, boiling model, surface tension, reactions, granular model and Dense Particulate Coupling (DDPM)		✓	✓
Full particle tracking including break-up, coalescence, erosion, evaporation, thin wall films, reactions and macroscopic model		✓	✓
Chemical Reactions: combustion and reacting flows including pollutants/soot modeling, FGM and Finite Rate combustion models, effusion cooling models, electro-chemistry, corrosion, fuel cells, electrolysis, battery models		✓	✓
Heat Transfer: radiation models, heat exchanger model		✓	✓
Real fluid properties (e.g. steam, cryogenic fluids)		✓	✓
Turbomachinery and Rotating Models: turbomachinery aerodamping and blade flutter analysis, blade film cooling model, periodic interfaces, turbo interfaces including mixing plane and pitch change		✓	✓
Dynamic mesh, overset mesh and mesh adaption (including Polyhedral Unstructured Mesh Adaption)		✓	✓
Acoustics		✓	✓
1-way and 2-way physics couplings, including Fluid-Structure Interaction and thermo elasticity		✓	✓
Multi-GPU solver			✓
HPC: 40 SMs (streaming multiprocessors) for GPU solver, additional SMs accessed via Ansys HPC licensing			✓
Fluent Icing workspace			✓
Fluent Aero workspace			✓
Polyflow Capabilities Details	Pro	Premium	Enterprise
Extrusion, co-extrusion, fiber spinning, blow molding and thermoforming (no viscoelasticity or yield stress models)	✓	✓	✓
Mixers, screw extruders, filling, 2D/3D forming, viscoelasticity & materials with yield stress			✓

# GPUs Are Critical to the Next Generation of HPC

Engineers want to use simulation to see how their ideas will perform against millions of variables

- Huge numbers of simulations
- Reduce time to market
- Need drastic increase simulation throughput

→ Without compromising accuracy!

The time is now for general purpose GPUs in scientific computing

<https://www.nextplatform.com/2019/07/10/a-decade-of-accelerated-computing-augurs-well-for-gpus/>

# ANSYS Solutions Have Leveraged GPUs For Years

- Ansys Flagship Products such as Fluent, Mechanical, HFSS and Maxwell use GPUs as accelerators in “offload”
  - GPUs have large bandwidth and computational throughput
  - Good for isolated, expensive computations
  - Solver modules like linear algebra, ray tracing, radiation models can run efficiently on GPUs

**Fluent**

**Mechanical**

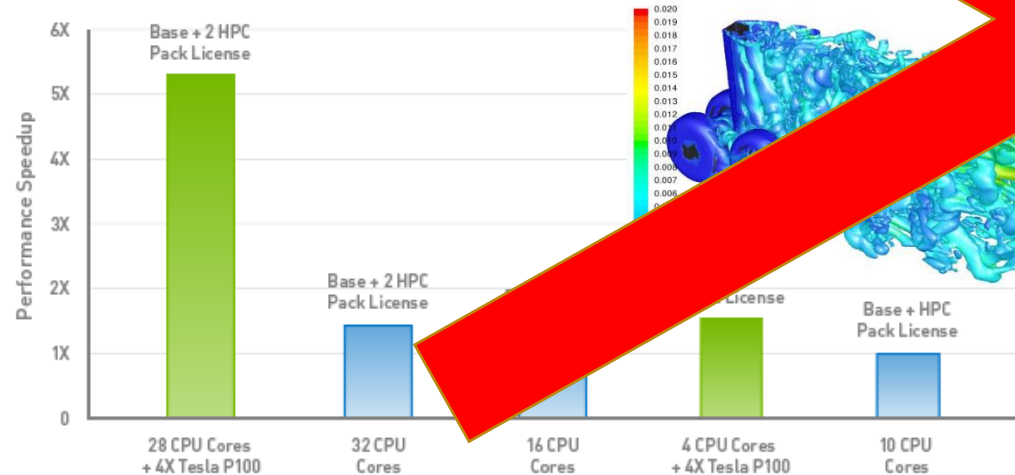

**HFSS/SI-Wave**

# Using GPUs to Accelerate CFD Solutions is Not New

## AMGX solver

- Linear solving offloaded to GPU
- Beneficial for explicit and LES with coupled solver
- Enhancement case
- 4X speedup for this case
  - 28 CPU cores + 4 GPUs per node
  - 32 CPU cores only per node

ANSYS Fluent (Boeing Landing Gear) Performance on CPU and GPU Systems

Dual Intel Xeon Haswell-EP E5-2698 v3 2.3GHz, 16-cores | Tesla P100 | 256 GB RAM | CentOS 7.2 64-bit | Ansys Fluent 18.1 | Boeing Landing Gear Analysis, Double Precision, 15M mixed cells, 100 iterations

## DO radiation solver

- Mixed CPU/GPU computing
- General benefits observed
- 3X speedup for DO 14M cell case
  - 28 CPU Cores + 4 GPUs per node vs
  - 32 CPU Cores only per node

ANSYS Fluent (Headlamp DO Radiation) Performance on CPU and GPU Systems

Dual Intel Xeon Haswell-EP E5-2698 v3 2.3GHz, 16-cores | Tesla P100 | 256 GB RAM | CentOS 7.2 64-bit | Ansys Fluent 18.1 | DO Radiation on Headlamp Simulation, Double Precision, pressure-based, laminar solver, 2x2 pixelation, 25 iterations

# Native GPU Implementation Shows Outstanding Performance Gains

DrivAer 250M LES Speedup with 176 CPU cores as base  
One A100 40GB replaces ~540 CPU cores, or ~12 nodes  
One 8-GPU node replaces ~96 high-end CPU servers

- / 2 typical GPUs > 1,000+ CPU cores
- / ~7x cheaper hardware purchase cost
- / ~4x lower power consumption

# Native GPU Benefits Go Beyond Fast Turnaround

- Metrics based on Cloud compute power consumption and costs from a mainstream CSP
  - CPU cluster with 1024 Intel® Xeon® Gold 6242 cores
  - GPU server with 6x NVIDIA® V100 cards

- **4X Power Consumption Reduction**

- CPU consumption = 9,600 W
- GPU consumption = 2,400 W

- **7X Hardware Cost Reduction**

- HW cost for CPU ≈ \$500K
- HW cost for GPU ≈ \$71K

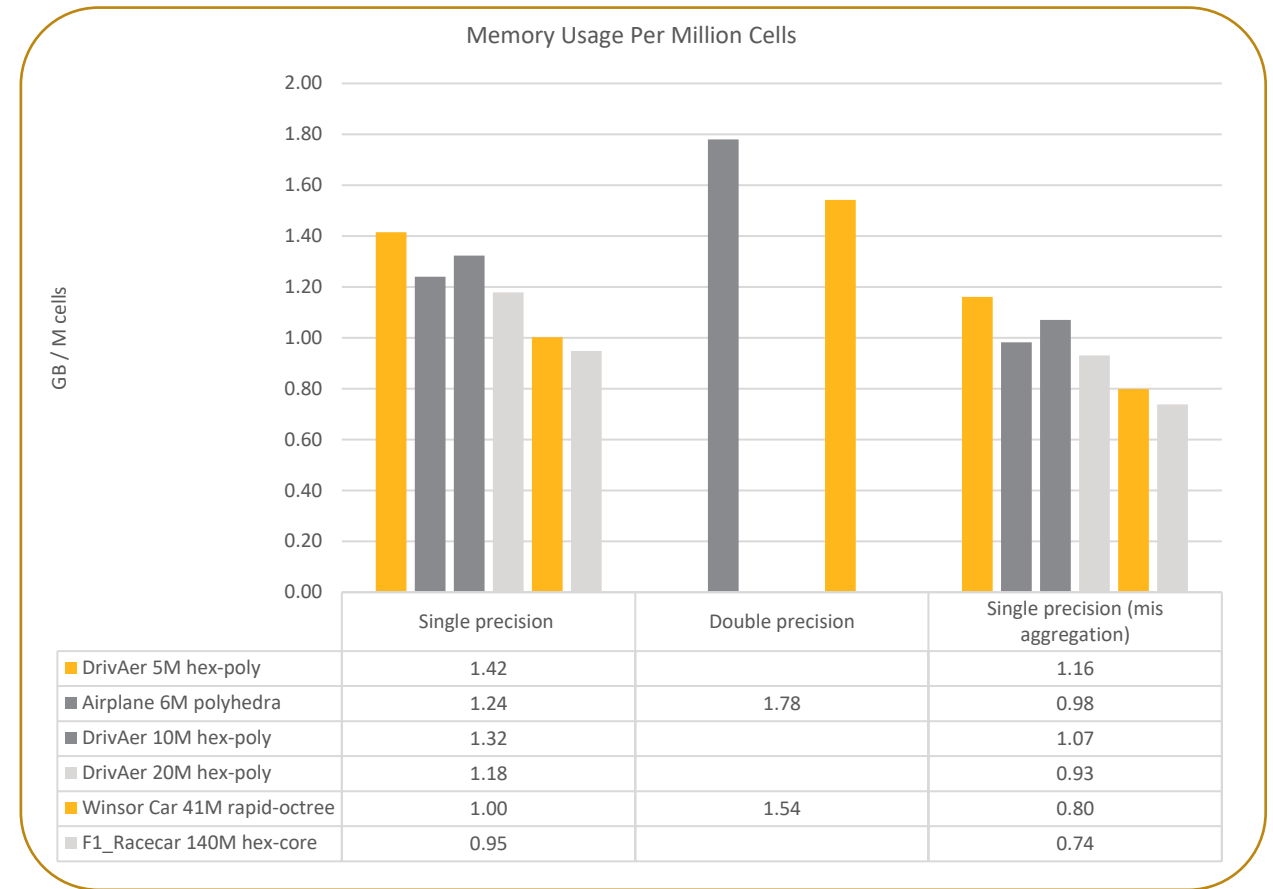

# Fast & Memory-Efficient

- “One DGX replaces 30+ high-end dual CPU servers”
- 1 – 1.5 GB/M cells Single Precision; 1.5 – 2 GB/ M cells Double Precision

**Low Memory footprint**  
100M cell case fit into 1 single A100 !

# Multi-GPU Solver in Fluent: Release Timeline

**UTILIZE THE POWER OF MULTIPLE GPUS TO ACCELERATE YOUR CFD SIMULATIONS**

## Beta support for :

- Single/multi-GPU (shared / distributed memory)
- Steady & transient simulations
- Incompressible & subsonic compressible flows
- All mesh types
- Ideal Gas and Materials with variable properties
- Turbulence: standard k-e, SST, GEKO, RKE, SBES
- Solid conduction and CHT
- Porous media
- Windows and Linux

## Beta support for :

- Transient scale-resolving simulations
- Non-conformal mesh interfaces
- Moving walls & Moving Reference Frame

2022/R1

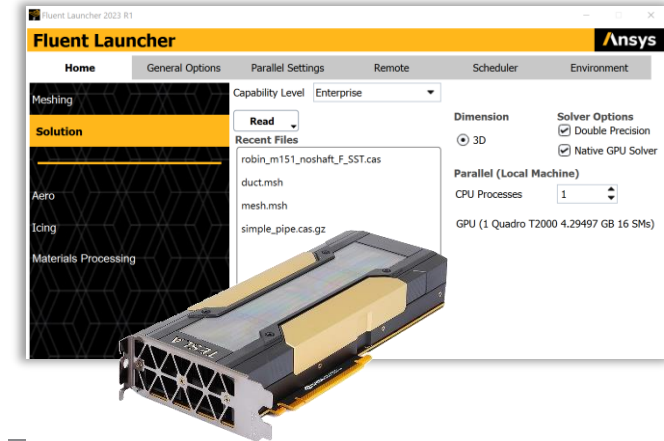

2022/R2

2023/R1

2023/R2

## All previous features released, along with :

- Various numerics improvements
- Enhanced robustness and accuracy for RANS
- Species transport
- Enhanced LES numerics
- Improved UX and launcher enhancement
- ...

## All previous features released, along with :

- Sliding meshes
- Non-stiff reacting flows
- Compressible flows
- ...

# / Can I Run the Fluent GPU Solver in Workbench?

The Fluent GPU Solver under Workbench can be turned on with an environment variable:

- Windows
  - `set FLUENT_GPU_DEVICES=all`
- Linux
  - Csh
    - `setenv FLUENT_GPU_DEVICES all`
  - Bash
    - `export FLUENT_GPU_DEVICES=all`

# Licensing & Hardware

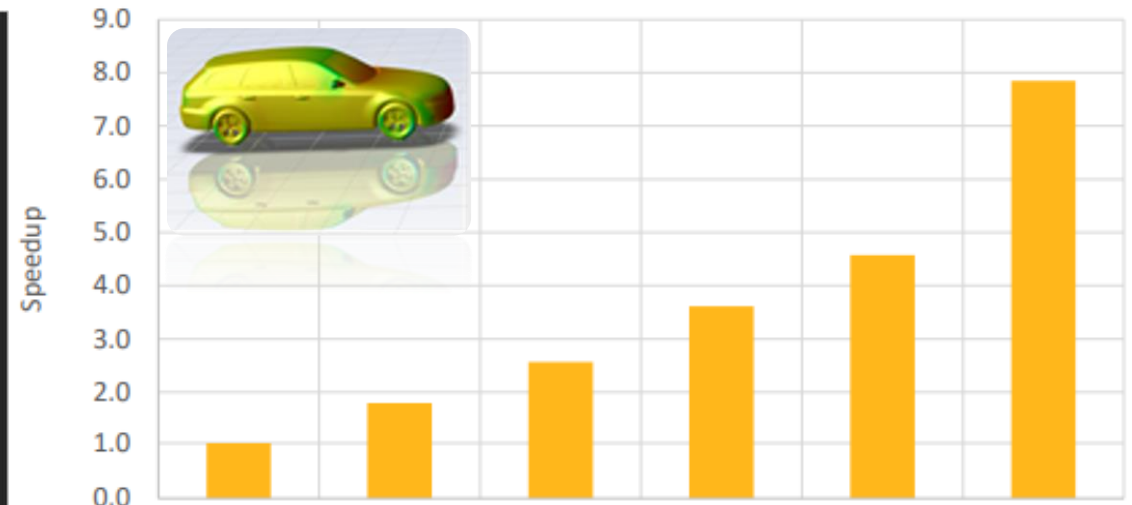

# What are Streaming Multiprocessors (SMs)?

- HPC licensing for the native GPU solver is based on the total number of streaming multiprocessors (SMs) used across all GPU cards
- GPU cards are made up of many SMs, and each SM contains many CUDA cores
- More powerful GPU cards typically contain more SMs

Tesla P100 Layout: 56 SMs, 3584 CUDA cores

Car 2M Hex-poly mesh, Flow + Turbulence, single GPU

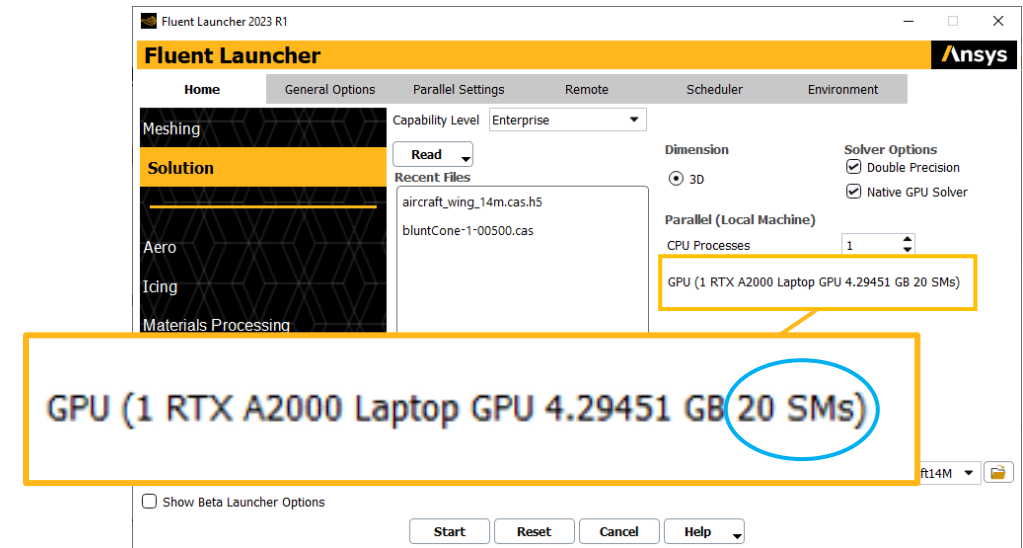

# SMs	28	56	80	80	108
# CUDA	3840	3584	5120	5120	6912

# Licensing

- 40 SMs are included with CFD Enterprise
- Additional SMs enabled with Ansys HPC/Packs/Workgroups
  - 1 HPC task = 1 additional SM
  - HPC Packs scale as usual (e.g. 3 Packs enables 128 additional SMs)

## Note:

- Fluent pre/post-processing for the GPU solver can use multiple CPUs without consuming additional HPC tasks
- Licensing is based on the total number of SMs across all GPUs, irrespective of the number of GPUs
- The Fluent Launcher and the Fluent TUI display the number of SMs in use
- All available SMs are used on a GPU card. It is not possible to restrict usage to a subset of SMs

	# SMs	HPC Workgroup	HPC Packs	
<b>EXAMPLE</b>	• <b>A100 GPU card contains 108 SMs</b>			
	• <b>4 x A100 GPU cards requires: (4 * 108) - 40 = 392 HPC tasks</b>			
	• <b>4 HPC Packs or 392 Workgroup tasks</b>			
		1 – 40	0	0
		41 – 48	1 – 8	1
		49 – 72	9 – 32	2
	73 – 168	33 – 128	3	
	169 – 552	129 – 512	4	
	553 – 2088	513 – 2048	5	

# HPC Requirements for Common GPUs

GPU Card	Description	#SMs	RAM (GB)	~CPU Core Equivalent	Max Problem Size* (1 GPU)	#HPC Packs
RTX A2000 Mobile	Released 2021. Standard laptop GPU.	20	4	6 – 12	3M cells	0
Quadro P2000 Mobile	Released 2017. Standard laptop/desktop GPU	6	4	10 – 15	3M cells	0
Quadro T2000	Released 2019. Standard laptop GPU	16	4	10 – 15	3M cells	0
Quadro P6000	Released 2016. Older high-end workstation GPU	30	24	50 – 90	20M cells	0
Quadro RTX 4000	Released 2018. Typical workstation GPU	36	8	60 – 100	7M cells	0
Tesla P100	Released 2016. Older server GPU	56	16	100 – 130	13M cells	2
Quadro RTX 6000	Released 2018. High-end workstation GPU	72	24	120 – 200	20M cells	2
Tesla V100	Released 2017. Previous gen server GPU	80	32	150 – 220	27M cells	3
Quadro RTX A5000	Released 2021. Top-end workstation GPU	64	24	130 – 220	20M cells	2
Tesla A100	Released 2020. Top-end server GPU	108	40, 80	200 – 400	33M, 67M cells	3
Tesla H100	Expected Q3 2022. Next-gen server GPU	132	80	Not yet tested	67M cells	3

\* Assuming 1.2GB RAM per millions cells. Actual RAM requirements will be case specific and will depend on the mesh type, physics solved, single vs double precision and other factors. Larger mesh sizes can be solved using multiple GPUs.

# 23R2 Features

# 23R2 Feature Status

## *Release*

Low speed compressible solver

Sliding mesh

EDM combustion model

Extended monitors - Async monitors

Extended monitors - Point/cut plane monitors

Extended monitors - Mass averaged and Sum

Expanded profiles - species + cell zones

GPU/CPU remapping - Invoke with -gpu\_remap

## *Beta*

Coupled solver

Rotational periodic

Anisotropic heat conductivity

UDS - Support constant or profile conditions

Morphing and parametric

Poor mesh numerics

DVS export directly

Fast restart with lightweight Fluent

# GPU Solver: Sliding interfaces

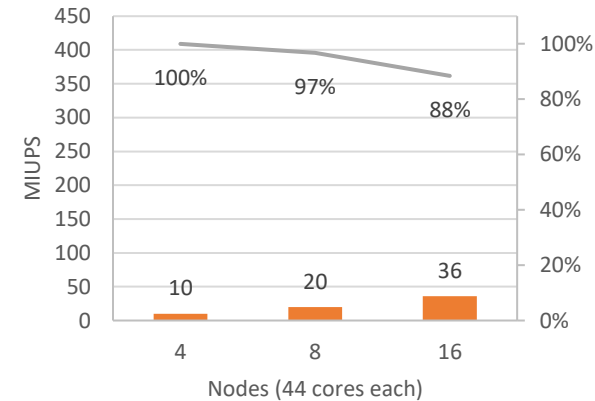

## Model rotating and stationary components

- An efficient and robust sliding mesh algorithm
- Enhanced robustness of dramatically changing intersections
- Test case: F1 140M rotating wheels, URANS SST

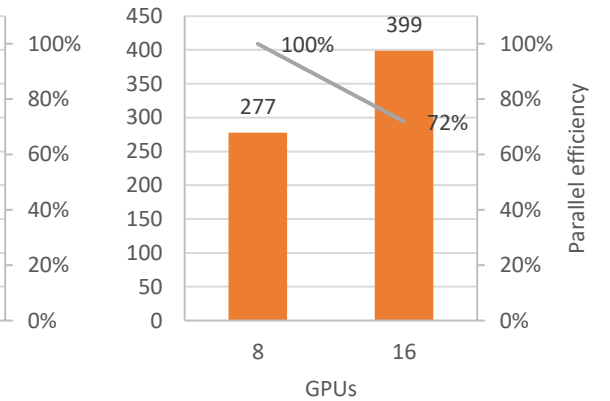

Intel Platinum 8168 dual-socket cluster  
Nvidia A100 40GB 8-GPU per node

F1 Racecar Sliding Mesh 140M CPU Scalability

F1 Racecar Sliding Mesh 140M GPU Scalability

**1 GPU ~ 16 CPU nodes (704 cores)**  
**With 8 GPUs, solve 1000 steps in 40 minutes!**

# GPU Solver: Compressibility

***The Fluent GPU solver now supports low-speed compressibility in addition to incompressible flow***

*Centrifugal blower with compressible flow and sliding mesh*

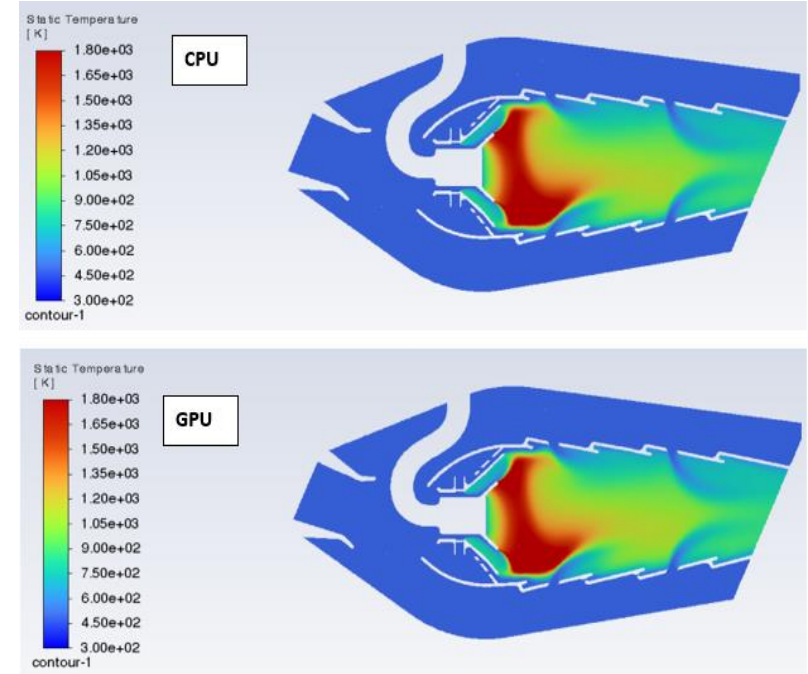

# GPU Solver: Combustion

## The Eddy Dissipation Model is now available with the GPU Solver

- Reaction rates obtained from turbulence parameters
- Improved robustness for variable density flows
- Test case
  - Generic Combustor, 12M polyhedral cells
  - 5 species, 1 reaction
  - EDM combustion model
  - Realizable K-epsilon turbulence
  - Intel(R) Xeon(R) CPU E5-2690 v3 @ 2.60GHz vs NVIDIA A100 80 GB

Matching static temperature profiles

Matching maximum and average temperature and mass fractions

CPU		GPU	
Area-Weighted Average Static Temperature [K]		Area-Weighted Average Static Temperature [K]	
outlet_hot	814.90027	outlet_hot	816.33144
Maximum of Facet Values Static Temperature [K]		Maximum of Facet Values Static Temperature [K]	
outlet_hot	1120.1417	outlet_hot	1109.9822
Maximum of Facet Values Mass fraction of co2		Maximum of Facet Values Mass fraction of co2	
outlet_hot	0.046799511	outlet_hot	0.045978013
Area-Weighted Average Mass fraction of co2		Area-Weighted Average Mass fraction of co2	
outlet_hot	0.023473894	outlet_hot	0.023566746

Intel(R) Xeon(R) CPU E5-2690 v3 @ 2.60GHz vs NVIDIA A100 80 GB

**Single GPU ~ = 576 CPU cores**

**Two GPU ~ = 860 CPU cores**

# GPU Solver: Turbulence

- Enhanced robustness
- RANS equation solution frequency controls for SBES

400 steps	Timing standard	Timing when updating $k+\omega$ every 5 <sup>th</sup> step only
CPU (Milan 128 cores)	11792.5 [29.5 s/dt]	6533.2 [16.3 s/dt]
GPU (DGX 8 x A100)	357.6 [0.9 s/dt]	<b>255.7 [0.6 s/dt]</b>
Speedup	32.8 (1 GPU ~ 512 CPU cores)	<b>27.2 (1 GPU ~ 435 CPU cores)</b>

*Auto external aero case, 156M with SBES, DGX: 8 x A100 80GB, enables less than 1 day turn-around*

**0.6 s per time step for 156M cell external aero calculation**

# / Monitors and residuals

## *Asynchronous monitors and residuals*

- GPU Solver running asynchronously from UI
- Significantly enhanced throughput
- Invoke with `-gpu_async`
- Test case: Proprietary auto external case, 160M LES
  - Batch mode, 20~40% gains, eliminated overhead of monitors
  - GUI mode, 100+% gains

## *Support for point, plane and line monitors*

Auto external aero case, 160M LES, **time per step**, and performance gains with async monitors and residuals

# Extended monitors

- Added mesh object support
  - Point monitors
  - Cut plane monitors
    - All three plane types – coordinate plane, point and normal, three point
    - Both per-surface? selection and cumulative selection (multiple surfaces)
- Added support for new field variables:
  - Dynamic Pressure
  - Total Pressure
  - Pressure Coefficient
  - Velocity Magnitude
  - Mach Number
  - Q Criterion Normalized
  - Lambda 2 Criterion
  - Wall Shear Stress
- Added averaging support
  - Mass averaged
  - Sum
- Optimized Fluent coupling with GPU monitors
  - Removed CPU side overhead, the default sync mode is improved significantly from before
    - E.g. 52" → 34" for one case

# CPU/GPU remapping

- Enable configurable CPU to GPU count mapping, instead of fixed 1:1
- Help with initialization, post processing, I/O and other CPU intensive operations
- Invoke with command-line `-gpu_remap`
- Test case: Generic\_F1\_310M
  - t8 original – t8 with 8 GPUs
  - t32 remap – t32 with 8 GPUs remapped
  - I/O time significantly reduced
  - Setup time moderately increased
  - Iteration time lightly increased
  - Overall, 25% performance gain

# Extension to the latest NVIDIA architectures

- Extended GPU Solver build to latest architectures, e.g., Hopper and future architectures
- The 2023 R2 release runs on NVIDIA H100 and RTX 6000 Ada
- H100 has about 18~25% performance gains over A100
  - H100 1944 GB/s, 114 SMs (PCIe version)
  - A100 1944 GB/s, 108 SMs

MIUPS = Million cell Iteration Updates Per Second  
(i.e. Iteration Updates Per Second Per Million Cells)

# Benchmark Suite

## 10 GPU benchmark cases are now available

- car\_2m, sedan\_4m, airplane\_10m, combustor\_24m, exhaust\_system\_33m, winsor\_41m, drivaer\_50m, f1\_racecar\_140m, drivaer\_250m, open\_racecar\_280m
- Different mesh sizes, types
- Segregated, coupled
- Incompressible, compressible
- RANS, LES
- Steady, transient
- Simple python scripts to conveniently run the benchmarks

## Fluent GPU Solver Benchmarks

For Fluent 2023 R2 and newer

### 1 Where to download files

Get latest Fluent 2023 R2 or newer versions and install it

#### 1.1 Get the new case files

OneDrive for these cases: [GPU Solver Additional Benchmarks](#)

car\_2m, airplane\_10m, combustor\_24m, winsor\_41m, drivaer\_50m, drivaer\_250m

#### 1.2 Get the original standard benchmark files

Ansys customer portal for these cases:

<https://support.ansys.com/TrainingAndSupport/ANSYSFluentBenchmarks>

sedan\_4m, exhaust\_system\_33m, f1\_racecar\_140m, open\_racecar\_280m

#### 1.3 Placement

copy the .tar files to Ansys installation under [path]/[ansys\\_inc](#)/v<version>/fluent

```
tar -xvf <case>.tar
```

Repeat [above](#) steps for each individual case [packages](#).

### 2 Commands to run

Please first make sure you have python command available from Python3 package

#### 2.1 Example to run 8, 4, and 2 GPUs for cases airplane\_10m and combustor\_24m

```
python ansys_inc/v232/fluent/bench/bin/fluent_benchmark_gpu.py -gpu -cores 8,4,2 -cases airplane_10m,combustor_24m
```

#### 2.2 Example to run 4 GPUs for case airplane\_10m on AMD GPUs

```
python ansys_inc/v232/fluent/bench/bin/fluent_benchmark_gpu.py -gpu.amd -cores 4 -cases airplane_10m
```

### 3 Case description

#### 3.1 car\_2m: External Flow over [DrivAer](#) car model

Size: 2M cells

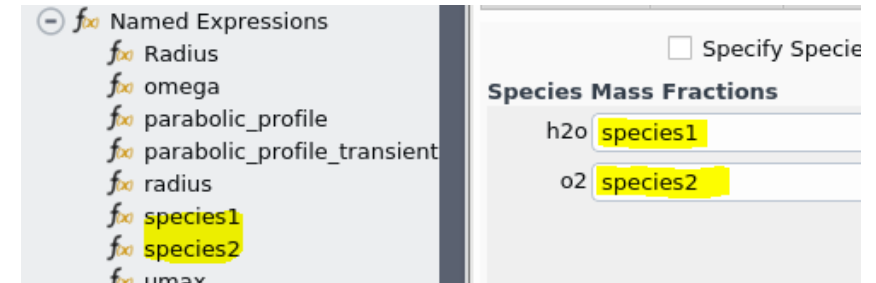

Cell Type: Projected Octree

Solver: Pressure based segregated solver, Least Square cell based, steady

Models: GEKO k-omega Turbulence

# GPU Solver: Expanded profiles and added UDS

- Profiles
  - Cell zone source as profiles
  - Boundary condition profiles for species and UDS
- UDS (beta)
  - User defined scalar transport equations with associated boundary conditions
  - Steady and transient mode
  - Support for profiles (BC and cell zone source)
  - Up to 5 UDSs
- Test case for profiles
  - Parabolic species profile for o2 and h2o at the right-end (velocity-inlet) BC

# Coupled solver (beta)

- Steady-state (beta) available for testing
- Pseudo-transient (alpha) not yet ready for testing

49m DrivAer Performance		
	Time/it	Time/it/mi cells
CPU (-t40)	19.6 s	0.40 s
GPU (4 cards)	1.2 s	0.024 s

Hannover Inlet Guide Vane

# Rotational periodicity (beta)

- **Rotational periodicity added**
  - Segregated, coupled, NCI, ...

## Test case

- Hanover IGV
- 310K cells
- Compressible
- Pressure inlet, pressure outlet
- SST k-omega

CPU – Static pressure

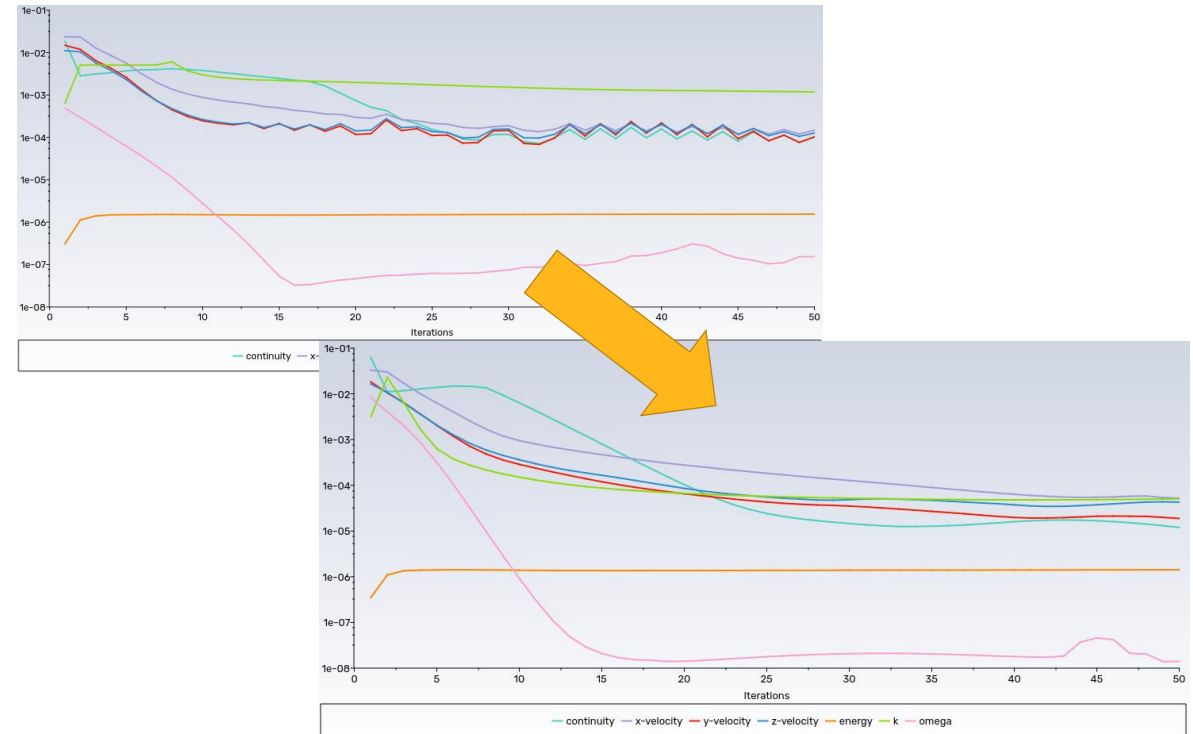

GPU – Static pressure

# Poor mesh handling (beta)

- **Poor cells identified using four criteria**
  - Minimal orthogonal skewness ( $<1e-04$ )
  - Maximum face warpage ( $>0.5$ )
  - Number of neighboring elements ( $>2$ )
  - Left handedness ( $<-1e-16$ )
- **Delete all marked cells**
  - Newly created boundary faces are set as wall boundaries
  - Marked cells visualized in poor cell marker in Fluent

Example: single precision run on mesh with poor elements and extreme stretching ratios

# Anisotropic thermal conductivity (beta)

- Solid thermal conductivity specified as a matrix:
  - Anisotropic
  - Orthotropic
  - Cylindrical orthotropic
- Matching GPU/CPU results

## Test case

- E-motor, 8M cells
- 2 fluids (air and ethylene)
- MRF
- heat sources

Fluent Solid Materials

aluminum (al)

Mixture: none

**Properties**

Density [kg/m<sup>3</sup>]: constant, 2719

Cp (Specific Heat) [J/(kg K)]: constant, 871

Thermal Conductivity [W/(m K)]: **anisotropic**

**Anisotropic Conductivity**

**Matrix Components**

XX	XY	XZ
1	0	0
YX	YY	YZ
0	1	0
ZX	ZY	ZZ
0	0	1

Conductivity [W/(m K)]: constant

# DVS export for post processing (beta)

- Export DVS files directly from GPU Solver
  - Transient and steady, GUI and TUI
  - Combination of cell and face zones and variables
  - Limitations: User-created surfaces not supported
- **Test case**
  - Helicopter, 4.43 million, two sliding zones, with 2 GPUs, 200 steps, export every 10 steps
  - DVS file size on disk: 15 GB for 20 exports
  - 5 minutes w/o DVS export
  - 6 minutes with DVS export, ~20% more time than without

# Demo: Full Wheel Axial Fan

# Axial Fan Geometry and Mesh

- Based on Axial Fan Workshop in Fluent Rotating Machinery Course
- Geometry: 30 rotor blades, 20 stator blades (full 360° modeled)
- Mesh: hex with inflation layers, non-conformal interfaces

Mesh type	Mesh Count	Min Orth. Qual.	Max Aspect
Hex	2,529,960	0.064	553

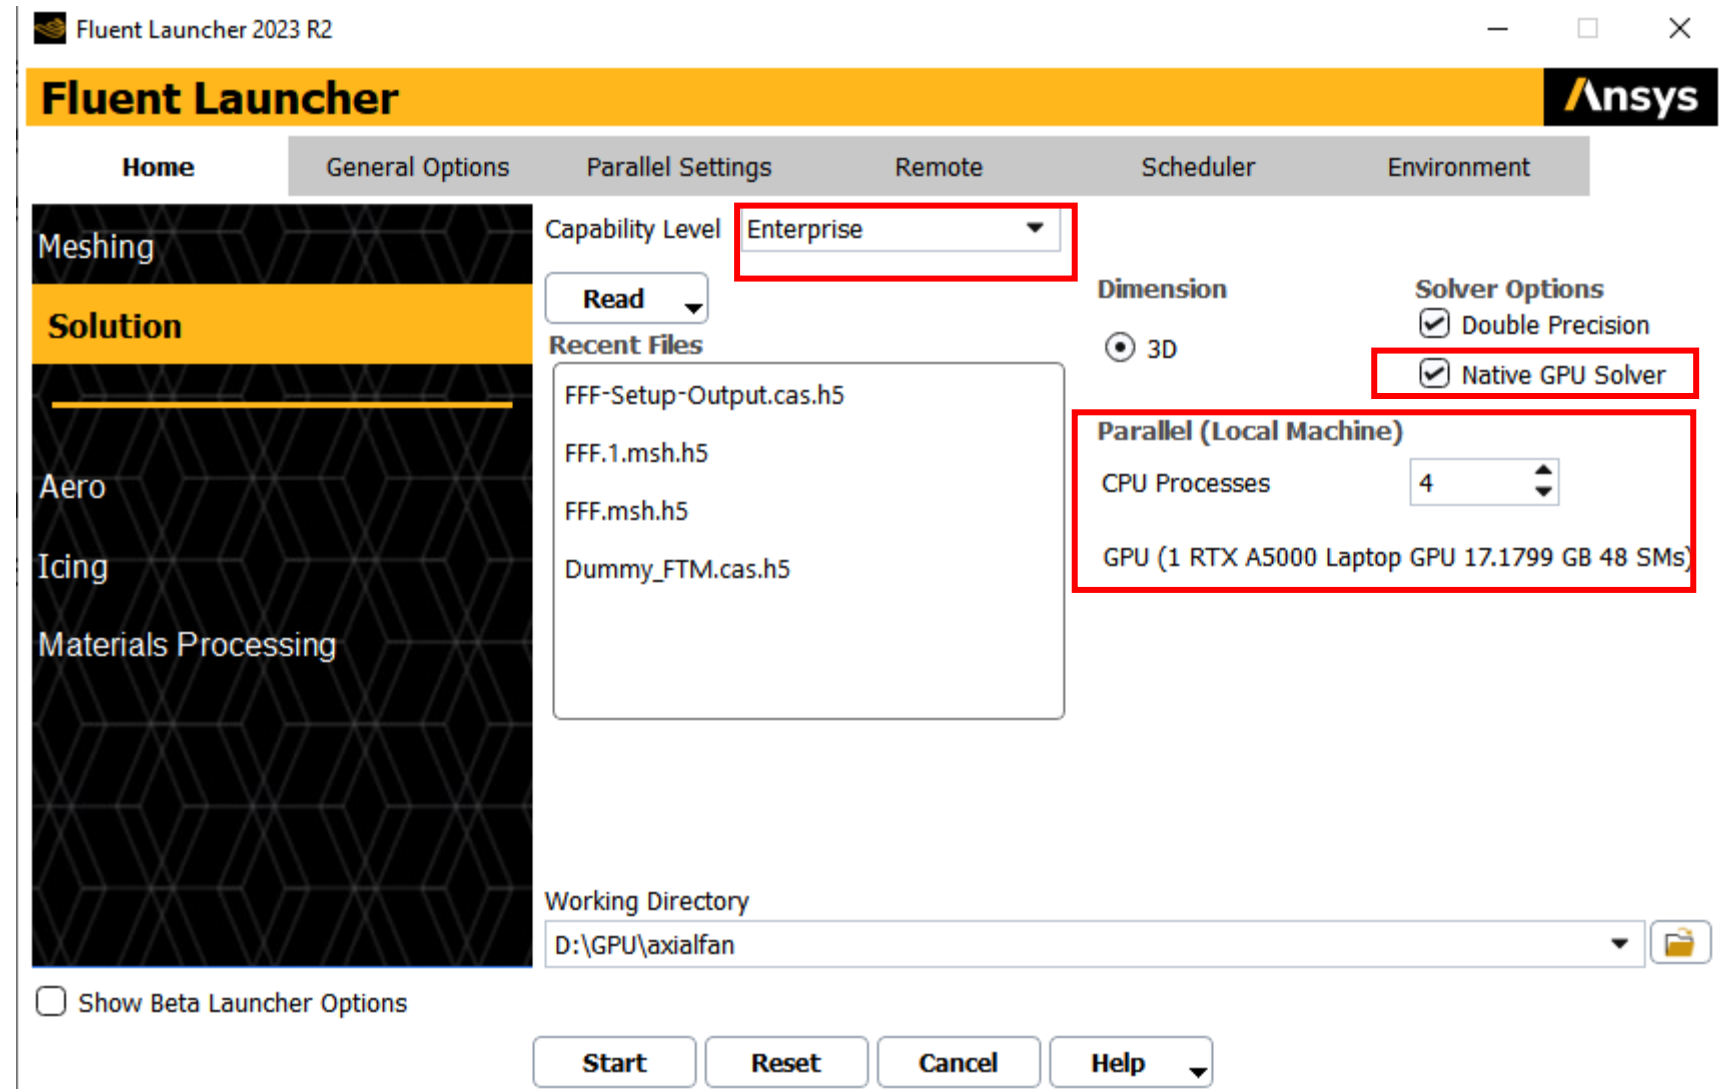

# / Hardware

- Dell Laptop CPU: 11th Gen Intel(R) Core(TM) i7-11850H @ 2.50GHz, 64 GB RAM, 8 cores
- Dell Laptop GPU: RTX A5000 Laptop GPU, V8.6, 16 GB, 366.272 GB/s, 48x128 cores 48 SM's

# Starting the Launcher

- Enterprise license level should be set in order to select the native GPU solver
- Problems are read in and set up on CPU's, when the solver is launched it switches to the GPU

# Switching to the GPU Solver

## Current License Usage

The screenshot shows the ANSYS Fluent interface with the 'Solution Initialization' panel open. The console window at the bottom displays the following information:

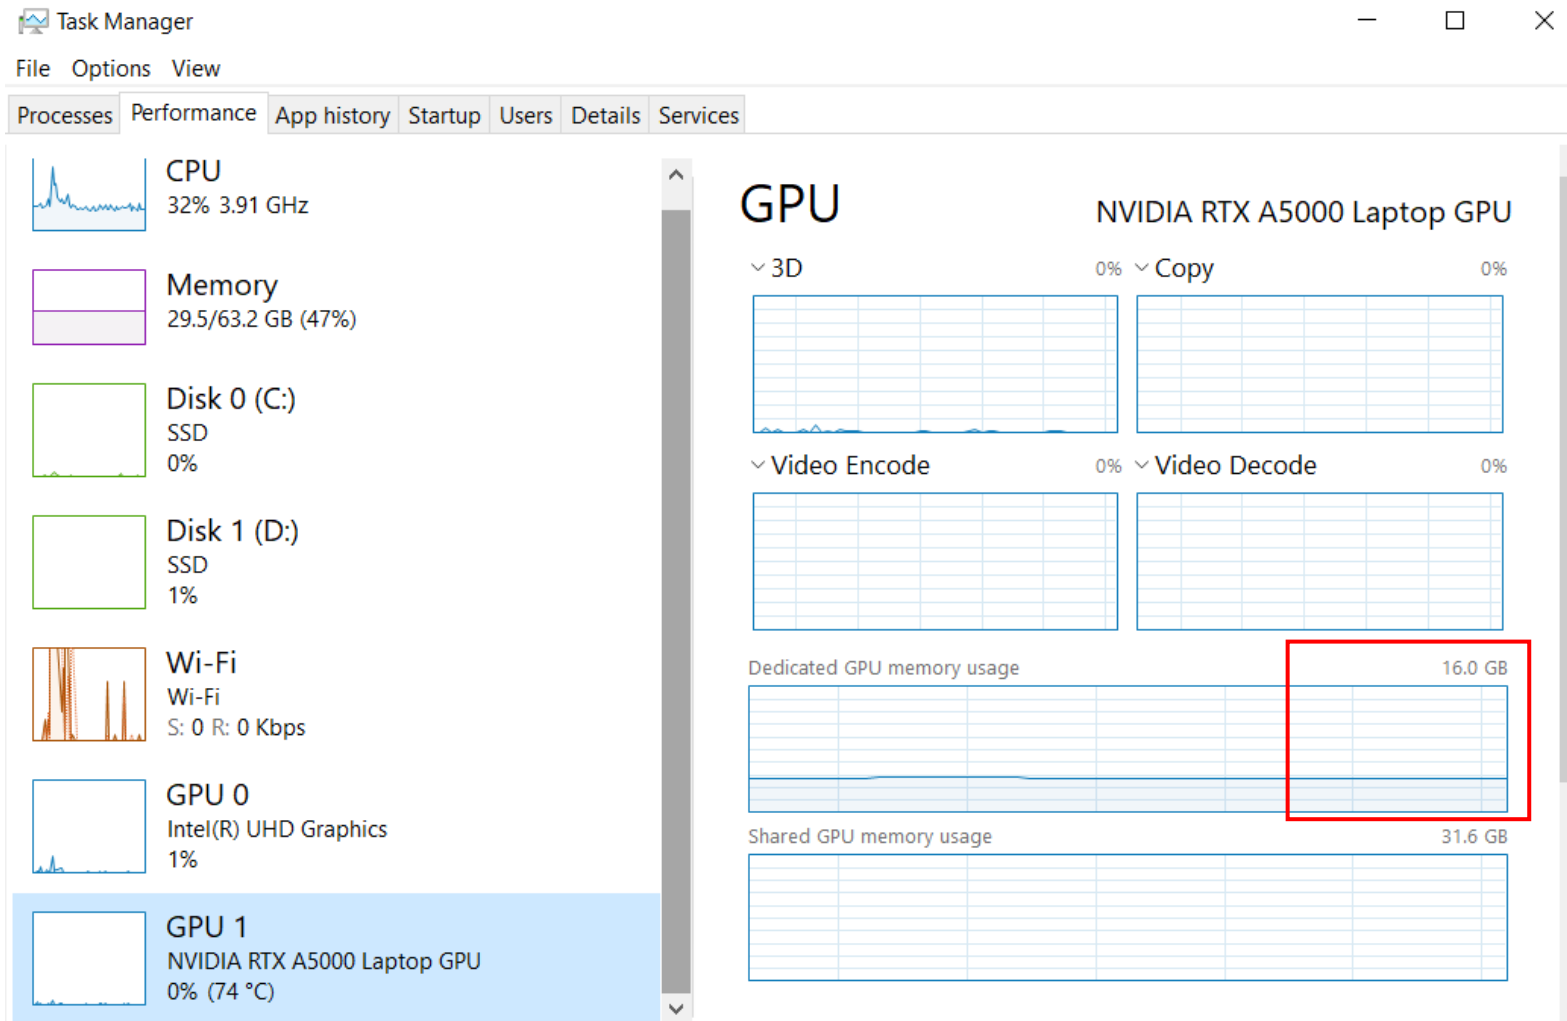

```

statool
rotor
mesh interfaces,
parallel,
Done.
Preparing GPU solver, please wait ...

Ansys Mechanical Enterprise (ansys)	0/10

48 SM GPU Card =  
1 HPC Pack

# Laptop Resource Usage

**2.5 M Cell Hex Mesh Case Requires 5 GB GPU Memory in Double Precision**

# Axial Fan (Mass Flow Inlet, Pressure Outlet)

ACE: Kurt Svihla

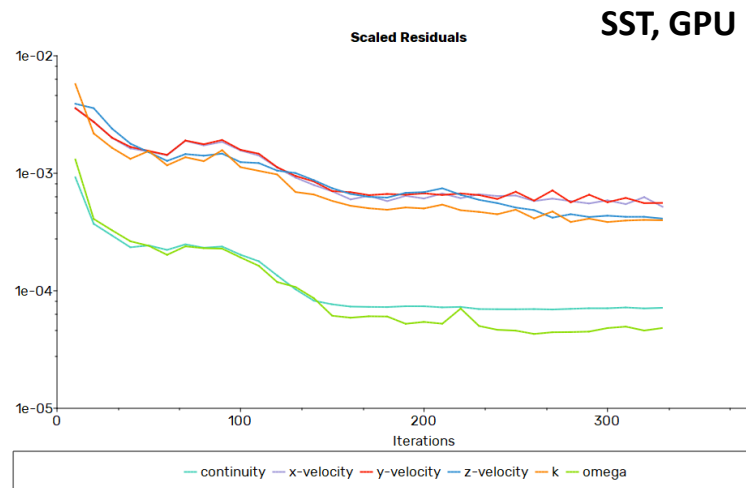

- **Geometry:**
  - Full 360° with rotor/stator cell zones

- **Mesh:**
  - Hex mesh (Turbogrid)
  - Prism layers, Max Aspect Ratio = 553
  - Cells: 2,529,560

- **Modeling:**
  - Standard and realizable k-ε, k-ω SST, GEKO
  - Constant density air
  - Nonconformal MRF for Frame Change
  - 2880 rpm

- **Numerics:**
  - Steady
  - Simple (P-V coupling)
  - Flow 2<sup>nd</sup> order upwind, turbulent spatial discretization: 1<sup>st</sup> and 2<sup>nd</sup> order upwind
  - Standard Initialization

- **Tested features:**
  - CPU vs GPU predictions
  - Solver robustness
  - Speed

## Conclusions:

- Overall results and solver performance satisfactory
- Significant speedup with GPUs

Solver	Cores	Turbulence Model	P-V Coupling	Fan Torque (Nm)	ΔP (Pa)	Iterations, Time to Converge
CPU	4	k-ω SST	SIMPLE	-20.01	1042.9	332, 975 s
CPU	4	k-ε Realizable	SIMPLE	-20.49	1075.8	332, 764 s
CPU	8	k-ε Standard	SIMPLE	-20.77	1112.8	332, 641 s
GPU	1	k-ω SST	SIMPLE	-19.77	1035.2	332, 94.8 s
GPU	1	k-ε Realizable	SIMPLE	-21.09	1131.0	332, 79.8 s
GPU	1	k-ε Standard	SIMPLE	-19.73	1052.0	332, 79.0s

# Summary

## / Unique tool for Ansys CFD

- The first of its kind in the marketplace
  - Most other GPU CFD codes are less generalizable (e.g., LBM and SPH codes)
  - Other Navier-Stokes GPU codes do offloading/acceleration

## / Exposed in Fluent

- Available with CFD Enterprise license
- Runs out-the-box without HPC licenses\*

## / HPC compatible

- Compatible with Workgroups and Packs
- Multi-GPU Cloud configurations available

*\*Depending on the type of card – see Solver Licensing section*

## Ansys **CFD Enterprise**

No compromise on accuracy

**Speed AND Accuracy: First-Of-Its-Kind Broad-Spectrum CFD Solver Built Natively on GPUs**

Since the advent of computational methods to solve physics problems, especially in the realm of fluid dynamics, scientists and engineers have had to balance the need for accurate simulations with faster times to solution — with available computing resources affecting this balance.

Now, we introduce to you a new broad-spectrum native GPU solver created by developers at Ansys. They've brought the same numerics that have made Ansys Fluent a trusted and market-leading CFD package across industries and employed ground-breaking parallelization techniques on GPUs to provide results at lightning speed.

This is a new beginning, but stands on the shoulders of decades of CFD experience and expertise.

The current document is intended to report accuracy of the Ansys native GPU solver for computational fluid dynamics (CFD). We report results for canonical problems in the literature typically used to validate/verify CFD codes. We want to bring you along on this journey that Ansys is taking to build the fastest broad-spectrum CFD code while still preserving accuracy. We trust that our methodical approach will extract the most out of fast-evolving GPU architectures and provide a strong platform to incorporate progressively more complex physics. The speed of the GPU solver on industry-strength problems is reported in a sequence of blogs.[1]

We will begin with details on a laminar flow case followed by several turbulent flow cases. For turbulent flows, we will show the performance of Reynolds-averaged Navier-Stokes (RANS) models, as well as scale-resolving stress-blended eddy simulation (SBES) and wall-adapting local eddy (WALE) turbulence models that have been implemented. Comparisons with experimental data when available are also presented.

**Laminar Flow Over a Sphere**

Our first step towards implementing physics is to ensure the solver performs well for laminar, steady-state flow configurations. Several canonical flow problems can be reduced to flow over a sphere. The literature is filled with experimental and numerical studies on this configuration. For this first test, we chose laminar flow conditions where the fluid is expected to go around the sphere and form time-invariant vortex structures behind the sphere (Figure 1). Drag coefficients based on experimental data are used to compare CFD results with experimental data.

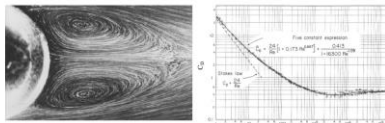

Figure 1 Time-averaged streamlines (left) and velocity magnitude contours on the surface of the sphere (right). Experimental data of drag coefficient are plotted as a function of Reynolds number from which the drag coefficient is determined.

At a Reynolds number of 100, simulation results show the expected steady-state vortices downstream of the sphere. Quantitative drag comparisons between simulation and experiment are within 1% of each other.

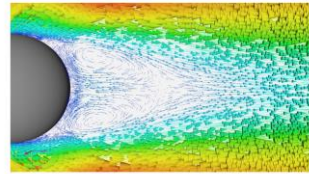

Figure 2 Velocity vectors showing the time-averaged symmetric vortex downstream of the sphere at Re=100.

	Drag Coefficient
Correlation**	1.0994
CFD (GPU, native)	1.0995

While this case may be a simple flow configuration, the ability to accurately capture the essential flow physics here lays the foundation for their implementation and test turbulence models.

## Unleashing the Power of Multiple GPUs for CFD Simulations

Computational fluids dynamics (CFD) engineers are keenly interested in accelerating their simulation throughput, whether that's by automating workflows, upgrading to newer/better methods, or using [high-performance computing \(HPC\)](#).

One topic of particular interest is the ways to achieve it — some more complex based CFD methods utilize GPUs.

In the continuum Navier-Stokes realm, the NVIDIA AmgX solver, which has been a dependent, and in the end, the portability of GPUs for CFD requires that

Ansys has been a trailblazer in the use of GPUs in the introduction of the Ansys multi-GPU solver.

Let's take a look at the benefits of running CFD simulations.

## Unleashing the Full Power of GPUs for Ansys Fluent, Part 1

Your commute home from work, the flight from New York to London, the old coffee maker at the office that your company still won't upgrade ... Just like computational fluid dynamics (CFD) simulations, all these things would benefit from being sped up.

Over the years, one of the key enablers of the years that has expanded to graphics cards (GPUs) in the CFD world is the introduction of [Ansys Fluent](#) since 2014). However, simulations are run natively on multi-GPU hardware.

This is the first installment of our blog series that can help reduce simulation time, help you solve turbulent flow problems. As the series progresses, we will highlight the benefits of GPU acceleration for CFD simulations.

ANSYS BLOG JUNE 30, 2022

## Unleashing the Full Power of GPUs for Ansys Fluent, Part 2

Imagine the time you could save throughout the year if you were able to save a few minutes, hours, or even days on each task. Well, if that task is computational fluid dynamics (CFD) simulation and you want to reduce solve times, the [Ansys Fluent](#) GPU solver could provide the solution.

Whether solving a 100,000-cell or a 100 million-cell model, a traditional approach for reducing simulation time is by solving on many CPUs. Another approach that has gained attention in recent years is the use of graphics processing units, or GPUs. This started when some parts of the CPU solution were passed to GPUs to accelerate the overall solution time, which is known as offloading to GPUs.

We implemented this offloading technology in Ansys Fluent back in 2014, but this year we are taking the use of GPU technology to a whole new level with the introduction of a native multi-GPU solver in Fluent. A native implementation provides all the solver features on the GPU and avoids the overhead of exchanging data between CPU and GPU, which results in better speedup when compared to offloading.

Unleashing the full potential of GPUs for CFD requires that the entire code runs resident on the GPU(s).

In [part 1 of this blog series](#), we highlighted a 32X speedup for a large automotive external aerodynamics simulation, but we understand not all users are simulating models that size. In this blog, we will highlight the power of GPUs for smaller models that contain additional physics capabilities, including porous media and conjugate heat transfer (CHT).

## 32X Speed Up in Aerodynamics

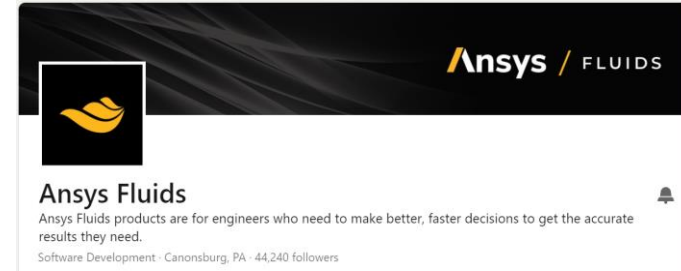

While this case may be a simple flow configuration, the ability to accurately capture the essential flow physics here lays the foundation for their implementation and test turbulence models.
